SUMMARY

Systems builder who turns manual, undocumented business processes into automated workflows that are tested, logged, and monitored. Work spans the full path a request takes: current-state documentation and requirements through data modeling, intake form design, API integration, error handling, and deployment. Recently designed and shipped an insurance submission intake and triage system on Azure AI Document Intelligence, using a Dataverse-shaped data model and Power Automate-style orchestration — deployed, documented, and publicly testable. Daily hands-on user of AI-assisted development tools for research, troubleshooting, testing, and delivery.

CORE COMPETENCIES

Business applications support · Workflow automation · Digital intake forms · Intelligent document processing · Azure AI Document Intelligence · Microsoft Dataverse data modeling · Power Automate orchestration patterns · CRM configuration and support · Current-state process documentation · Functional requirements · Business rules · Data requirements · Acceptance criteria · Workflow run monitoring and troubleshooting · Error handling and logging · Data quality and duplicate identification · Tables, fields, and relationships · APIs and integrations · Structured data and Excel · Pre-production through production deployment · User documentation and guidance · AI-assisted development tools

FEATURED PROJECT

Insurance Intake & Triage Automation — Self-directed build, 2026

insurance-intake-triage-automation.vercel.app · [source on GitHub](#)

An end-to-end submission intake workflow: digital intake form, document extraction, validation, duplicate detection, rules-based routing, acknowledgment, and full run logging. Built to demonstrate the intake automation and intelligent document processing this role supports.

- **Data model:** designed four related entities (Client, Submission, ExtractedPolicyData, AutomationLog) modeled on Dataverse conventions — 1:N and 1:1 relationships, alternate keys, and option-set constraints enforced at the database level rather than in application code.
- **Intelligent document processing:** integrated Azure AI Document Intelligence to extract policy fields from declarations pages, normalizing 25+ real-world label variants ("Policy No.", "POLICY #", "Policy Number") to seven canonical fields with currency and date parsing.
- **Human-in-the-loop by design:** extractions below a configurable 0.80 confidence threshold route to human review instead of proceeding. AI reads the document; a deterministic business-rules table decides routing, so every assignment is auditable and explainable.
- **Error handling and logging:** exception handling mirroring Power Automate Scope actions (Try / Catch / Finally), holding three invariants: no submission stranded mid-process, exactly one automation log per run, and no unhandled exception reaching the user. Failures land in a monitored exception queue.
- **Data quality:** duplicate detection across client, submission type, and line of business within a configurable 30-day window, flagged for operator confirmation rather than auto-merged.
- **Business analysis documentation:** authored current-state and future-state process documentation, functional requirements, business rules, data requirements, and acceptance criteria — with a test plan traced back to them.
- **Delivery:** 219 automated tests, TypeScript throughout, deployed on Vercel with a Postgres backend, scheduled daily data reset, and a health and diagnostics endpoint for monitoring.

Built with synthetic data only. Not work performed for any insurer or broker.

PROFESSIONAL EXPERIENCE

Systems Builder & Implementation Consultant

Independent | Kansas City, MO | 2023 – Present

- Scoped and delivered complete systems from requirements through production: user flows, interface design, database structure, workflow automation, API integrations, deployment, and ongoing support.
- Built Glide, an advisor-succession pipeline tool for NBC Trust — collected public-record and regulatory data through API connections, scored records on experience, geography, and fit, and produced a prioritized outreach pipeline from previously scattered research.
- Built the AI-powered tool stack behind Claya, connecting research, campaign launch, conversion, and daily optimization into one operating loop; raised landing-page conversion from 0.33% to 0.70% within seven days.
- Worked across CRM and pipeline systems (HubSpot, Salesforce) on lead scoring, pipeline visibility, funnel automation, and reporting.
- Used Claude Code, Codex, and Cursor as primary build environments to research solutions, troubleshoot production issues, write tests and documentation, and connect systems via API.

Growth Lead & E-commerce Operator

WyCo Vintage | Kansas City, MO | 2024 – 2026

- Generated \$1M+ in online revenue over 2.5 years through e-commerce operations, paid media, and structured creative testing.
- Managed acquisition, retargeting, and creative testing programs, tying campaign data to on-site conversion through regular structured reporting and analysis.

E-commerce Growth & Paid Media Strategist

Independent | Kansas City, MO | 2016 – Present

- Managed \$5M+ in paid advertising spend across Facebook and Google Ads for e-commerce, service, and direct-response clients.
- Designed landing pages and first-scroll experiences around direct-response principles: clear promise, visual proof, CTA hierarchy, objection handling, and fast comprehension.

Professional Athlete

Detroit Lions / Denver Broncos | National Football League | Two seasons

- Competed at the professional level; developed the discipline, rapid learning under pressure, and consistency of execution now applied to fast-cycle system delivery.

TECHNICAL SKILLS

Business Applications: Customer Relationship Management (CRM) support and configuration — HubSpot, Salesforce; workflow automation, digital intake form design, current-state and future-state process documentation, functional requirements, business rules, data requirements, acceptance criteria, user acceptance testing (UAT), user training and documentation

Microsoft & Azure: Azure AI Document Intelligence, intelligent document processing, Microsoft Dataverse data model conventions — the Dynamics 365 data platform — including tables, fields, relationships, alternate keys, and option sets; Power Automate orchestration patterns (Scope-based error handling); Microsoft 365 and Excel

Data: Postgres, Supabase, SQL, relational data modeling, data quality and deduplication, structured reporting, Excel

Development & Integration: TypeScript, Next.js, React, REST APIs, webhooks, Git and GitHub, Vercel, automated testing, pre-production through production deployment

AI-Assisted Development: Claude Code, Codex, Cursor, LLM workflow design, prompt engineering, AI-enabled workflow automation

EDUCATION

Master of Business Administration — Full Sail University

Bachelor of Science, Hotel and Restaurant Management — University of Missouri

Division I Student-Athlete, Four-Year Letterman
